Heat pumps applied to low and zero carbon buildings
Presented by John Felgate, Stiebel Eltron

The environment is full of power. You have to go as unbelievably low as -273°C until every last bit of energy has been drained from it. With heat pumps, at least some of this natural energy can be harvested and used for DHW and central heating. These systems are still effective at outside temperatures as low as -20°C . Calculated over a year, nature will grant you around half of your normal heating costs.

This talk explains how heat pumps work, how they combine with other renewable technologies and how they meet the needs of low and zero carbon housing.

Venue: Holiday Inn, Bostocks Lane, Sandiacre, NOTTINGHAM, NG10 5NJ

Directions: J25 M1

Date: Tuesday, 9 February 2010
Doors open at 18:30 for a 19:00 start to the presentation. Finish by 21:00.
